Synopsis of Research

My main research interests are in the fields of computer and network security. The main topics of my research are listed below, with referrals to the relevant journal (J), conference (C) and book chapter (B) publications listed in the CV.

(a) Privacy and Anonymity in the Electronic Society

Surfing the World-Wide-Web (hereafter: the Web) feels as if it is a bilateral private interaction. However, this impression is far from being accurate, as users leave identifiable digital tracks at every Web site they visit [J6]. Within my research, I have demonstrated how a collaborative attack on WWW users' anonymity can be performed by analyzing only a small part of the Internet routers [J18]. Additionally, I developed a new protocol that allows users to surf the World-Wide-Web while maintaining their anonymity [C9, J13]. The protocol was implemented by several Mix-type servers connected at different points to the Internet and by agents installed inside the users' computer. The protocol was extended to anonymize the P2P communication [C16], as well as another protocol that was developed for anonymous publishing [C54, C72].

The computer security community has concentrated on improving users' privacy by concealing their identities on the Web. However, users may want or need to identify themselves over the net in order to receive certain services, while retaining the privacy of their interests, needs and intentions. PRAW, the privacy model [C3, C4, C7, C15, J8, J9, J11], is aimed at hiding users' navigation tracks, in an attempt to prevent eavesdroppers from inferring their profiles, while still allowing them to be identified.

Securing data at rest stored in a database is a very challenging task. I've developed a new database encryption scheme named SPDE, which preserves the structure of the database and encrypts its content, such that even the DBA cannot view or modify the database cells content [C13, C18, J26].

(b) Malware Detection

The area of Cyber security covers the flagship project of T-Labs at BGU (Net Centric Security), which aims to purify NSP networks of malware [J35]. During the project, I developed methods based on machine learning techniques for detecting whether a suspected file is malicious or benign. The methods were based on static code analysis [C26, C31, C34, C35, C36, C39, C40, C43, C63, J21, J22, J44] and dynamic code analysis, where the suspected file activity was monitored in a sandbox [C19, C20, C21, C22, C23, C25, C29, C32, C33, C37, C42, J17, J19, J20, J27, J48]. One of the challenges in this research was the synthesis of powerful malware signatures yielding a low false-positive detection rate [J28, J36]. The issues of detection scalability and performance were addressed in [C27, C28, C41, C45, C52, C77, B6, B7, B9, J33, J15, J16, J24, J39], by employing the Complex Networks' theory to pinpoint the most influential set of routers for deploying monitoring and filtering devices. Currently, I am extending this research (including a simulator), to find the optimal places for deploying a scribing center for mitigating the denial of service attack launched via botnets.

(a) Mobile Phone Security

Before the Android-based mobile devices were introduced into the market for the first time by T-Mobile USA, I was asked to study Android vulnerabilities, threats and security mechanisms. My findings were summarized in several publications [C60, J31]. Following my analysis, I developed several security mechanisms for the android platform. First, I demonstrated how to secure Android mobile devices using SELinux [J32]. Then, I developed several prototypes of an Intrusion Detection System for hardening Androidbased devices based on various techniques, such as temporal reasoning and anomaly detection [C46, C50, C58, C61, J42, J34]. All of my publications on Android security are highly cited by the scientific and professional communities. In addition, an efficient, collaborative application-monitoring scheme was developed for mobile devices that will allow the devices to detect malicious applications without relying on a central authority [C51, C53].

(b) Web Intelligence and Social Network Security

Terrorist groups use the Web as their infrastructure for various purposes. The Advanced Terrorist Detection System (ATDS), which I designed, is aimed at tracking down online access to abnormal content, which may include terrorist-generated sites by analyzing the content of information accessed by the web users. ATDS was developed and evaluated using real users and terror-related data [C6, C8, C12, C14, C17, J7, J30].

In another research, I hypothesize that a new type of information security threat may involve a class of malware, which does not have a goal to corrupt and take control of the machines it infects or steal explicit information stored on them. Rather, its goal is to steal social network and behavioral information through data collection and network science inference techniques. I define this a stealing-reality attack [J40]. I demonstrated how such an attack can propagate in real social networks. Many journalists quoted the results of this study in their articles.

Link prediction in social networks is one of the key tools in web intelligence. It may allow identifying a connection between terrorists that does not exist in a social graph. I developed a very accurate link prediction algorithm that was evaluated on several large social networks [C73, J50]. The link prediction algorithm was used to detect fake profiles in social networks. Fake profiles in social networks may be used for good as well as malicious purposes. In [C81], I show how one can derive the organizational structure using socialbots. In [C82], I show how a fake profile that distributes Spam in a social network can be detected. The Social Network Protector was developed by me as well, which is a software based on advanced detection mechanisms that may allow teenagers to identify suspicious members in their social network. The Social Network Protector Facebook app was installed by more than 3000 users and Mr. Michael Fire, my Ph.D student, presented it live on FoxNews.
